

## **ABSTRACT OF THE DISCLOSURE**

[0053] Embodiments of the invention provide systems and methods for the dynamic creation and presentation of user-specified VOD content consisting of multiple VOD clips as a passive viewing experience. For one embodiment, a user selects a set of VOD clips from a list or other selection presentation and the selected VOD clips are presented back-to-back. For one embodiment of the invention, the user may reorder the presentation sequence of the selected VOD clips. Embodiments of the invention thereby allow a user to dynamically create and present a user-specific, passive viewing presentation.
